

SENIOR LEADERSHIP CONCEPT

Unified Project Management Suite

A credible path to replace fragmented Jira, Confluence, and manual reporting with one governed operating record.

Five-minute product walkthrough - feedback and requirement discovery

Concept prototype - 24 August 2026

ONE GOVERNED RECORD

WORK

KNOWLEDGE

LEADERSHIP

Execution and context stay connected from task to decision to briefing.

One operating record removes the handoffs.

The home view combines the questions that are split across Jira, Confluence, spreadsheets, and briefing slides today.

WORK

Accountable scope, owner, status, dependencies, and dates

KNOWLEDGE

Living context, evidence, comments, and version history

LEADERSHIP

Current intervention, risk, forecast, and briefing facts

Delivery stays accountable without losing context.

Board, backlog, workflow, issue detail, dependencies, risk, evidence, comments, and activity operate as one work record.

SPRINT FLOW

Move work with drag, controls, or editable status.

ACCOUNTABLE DETAIL

Follow a blocker directly to its decision and evidence.

Knowledge remains a living part of delivery.

The Confluence-style page is governed, versioned, searchable, and directly linked to decisions, work, risk, comments, and evidence.

One decision updates the operating picture.

Approval is not a note. It changes execution, schedule, risk, history, knowledge, notifications, and briefing facts together.

BEFORE

6 blocked · 23 Sep · 16/25

AFTER

0 blocked · 18 Sep · 6/25

Leadership sees traceable status, not a reconstructed slide.

The one-page readout refreshes from the same governed facts and links back to the decision, work, page, and risk.

DEMONSTRATED NOW

Connected workflow value
Session-only interactions
Synthetic traceability
Offline leadership tour

PRODUCTION MUST PROVE

Identity and permissions
Scale, security, integrations
Migration fidelity and support

Which workflow should we prove next?

The next step is requirement discovery - not approval or funding.

- 01** | Where would a connected work-and-knowledge record create the most value?
- 02** | Which existing Jira or Confluence workflow should be demonstrated next?
- 03** | What requirement or concern must be addressed before considering a pilot?

Live prototype: azjester.github.io/J-C_Replace/

Production requires a governed enterprise architecture.

Illustrative target architecture for Q&A - the current concept is only the presentation layer and in-memory state.

EXPERIENCE	Web application · mobile-responsive views · accessible workflows
CONTROL	SSO · role and attribute permissions · policy enforcement · approvals
DOMAIN	Work · knowledge · decisions · risks · search · reports · automation
DATA	Relational records · object storage · immutable audit · indexing · backup
INTEGRATION	GitHub · Microsoft Teams · BI · email · migration connectors · APIs

Migration should prove fidelity before cutover.

Atlassian remains authoritative until records, permissions, history, attachments, and links pass agreed validation gates.

VALIDATION GATES

Identity and permissions

Workflow and field mappings

Page hierarchy and version history

Attachments and cross-links

Counts, exceptions, and rollback
